

Phantom-Spend SaaS Auditor

B10X AI Generalist Hackathon Submission

 **Live Dashboard:** <https://saas-spend-engine.netlify.app/>

The Real-World Bottleneck

Mid-market companies and startups bleed tens of thousands of dollars annually on "Phantom Spend"—duplicate SaaS licenses, unused seats, and overlapping software capabilities (e.g., paying for both Jasper AI and ChatGPT Plus). Uncovering these overlaps requires hours of manual cross-referencing by human finance teams.

The AI Solution

The Phantom-Spend SaaS Auditor is a fully autonomous financial forensic engine.

It ingests chaotic, raw bank statement CSVs, isolates software expenses, and leverages an LLM as a semantic reasoning engine to map software capabilities. It doesn't just read data; it actively hunts for redundancies, flags exact overlaps, and calculates the exact dollar amount of wasted capital.

What used to take 8 hours of manual auditing now takes 14 seconds.

The Architecture & Tech Stack

This is a production-ready, event-driven pipeline.

- **Frontend:** React + Tailwind CSS (Hosted on Netlify).
- **Backend Orchestration:** n8n Webhooks.
- **AI Logic Engine:** OpenAI API (GPT-5-mini via Langchain node).
- **Data Flow:** React parses the CSV -> POSTs raw text to n8n -> AI Agent evaluates feature redundancy -> n8n strips formatting & returns strict JSON -> React renders the executive dashboard.

How to Run the Demo

1. Open the [Live Netlify Dashboard](https://saas-spend-engine.netlify.app/).
2. Upload a mock CSV containing corporate transactions (Tool Name, Monthly Cost).
3. Click "Run Autonomous Audit".
4. Watch the AI isolate redundancies and flag tools for **Cancellation, Consolidation, or Retention** in real-time.
